Orbital debris management for a sustainable space environment

Alberto Abiti - 41th Cycle

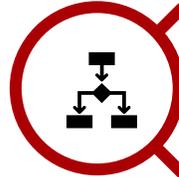

Meeting - 12/11/2025

Outline

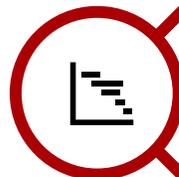

Orbital environment
sustainability

Doctoral work objectives

Project description

Gantt chart

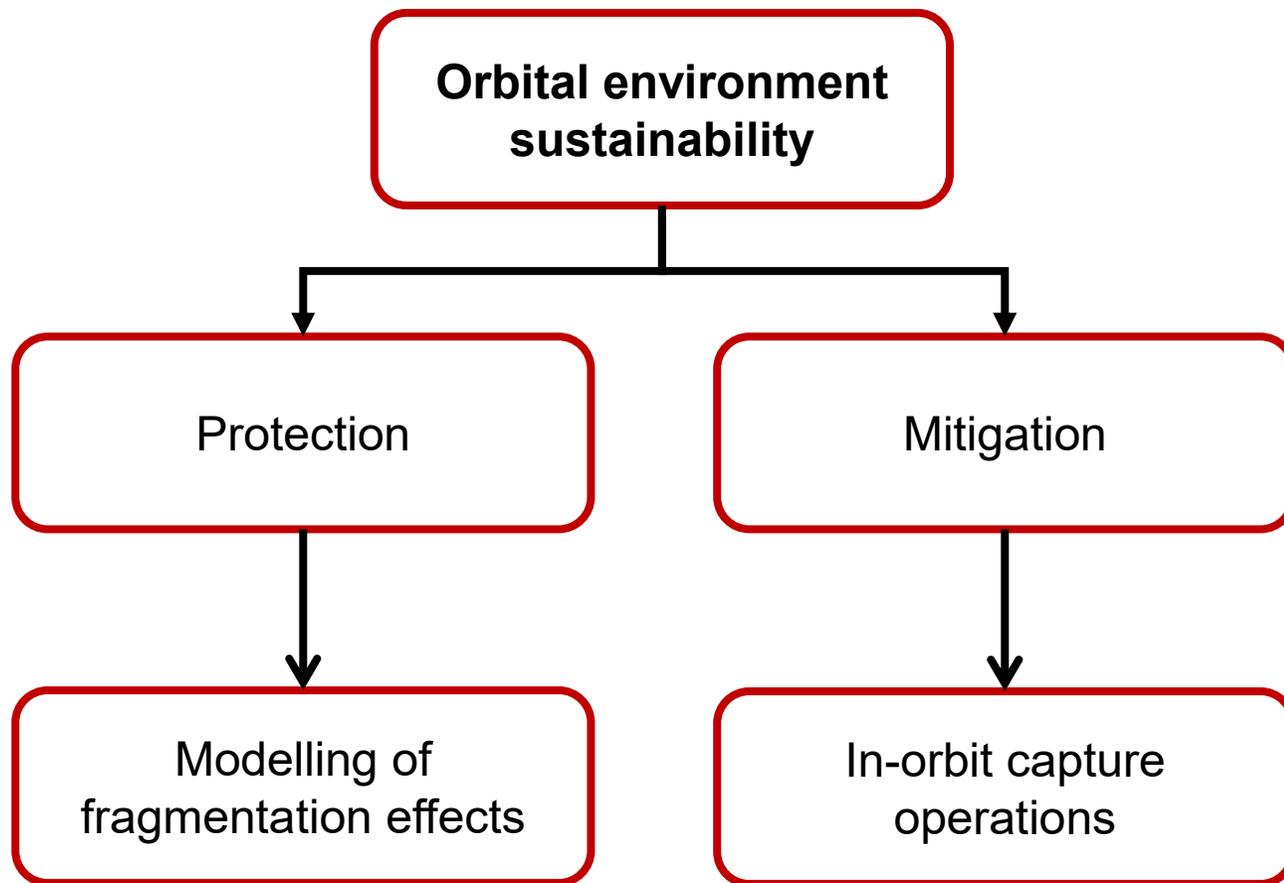

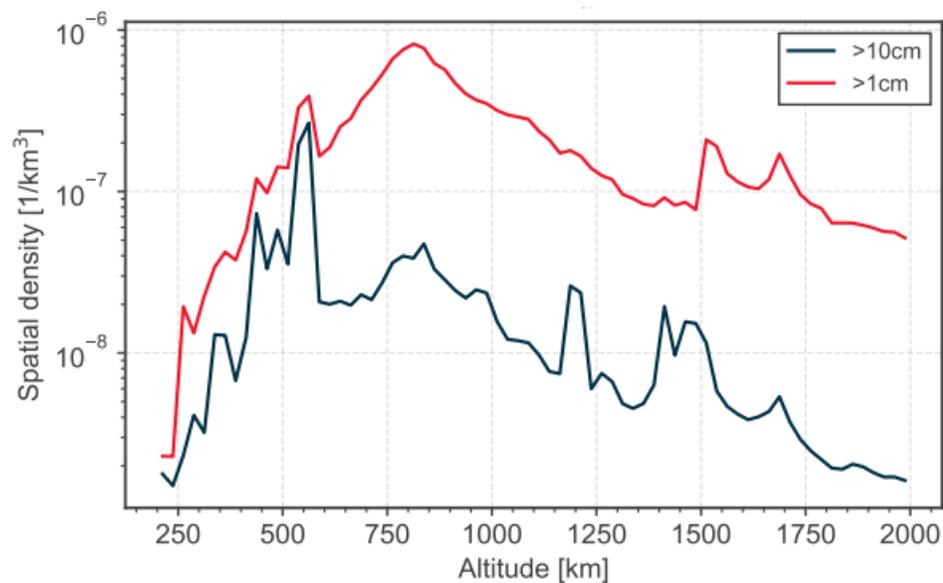

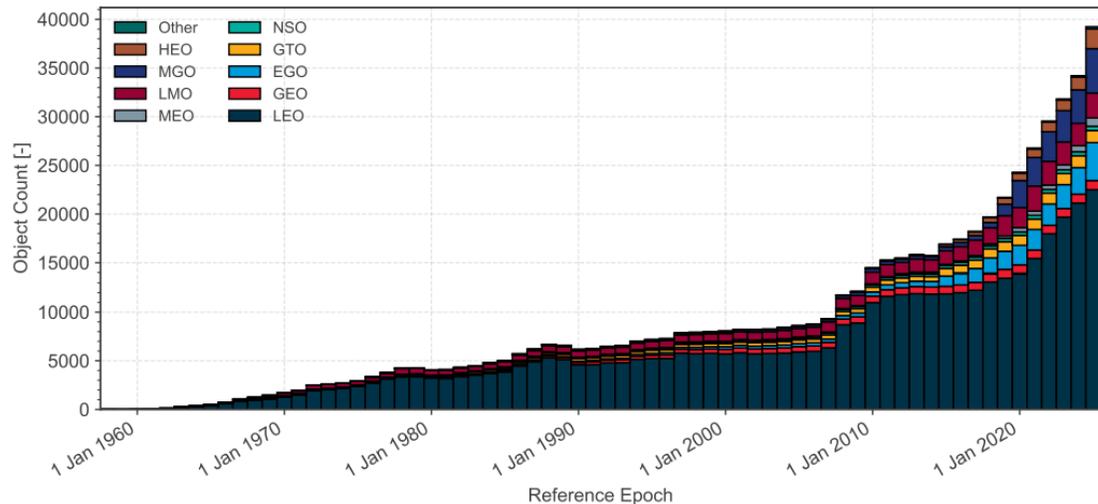

Main expected results

Orbital environment sustainability

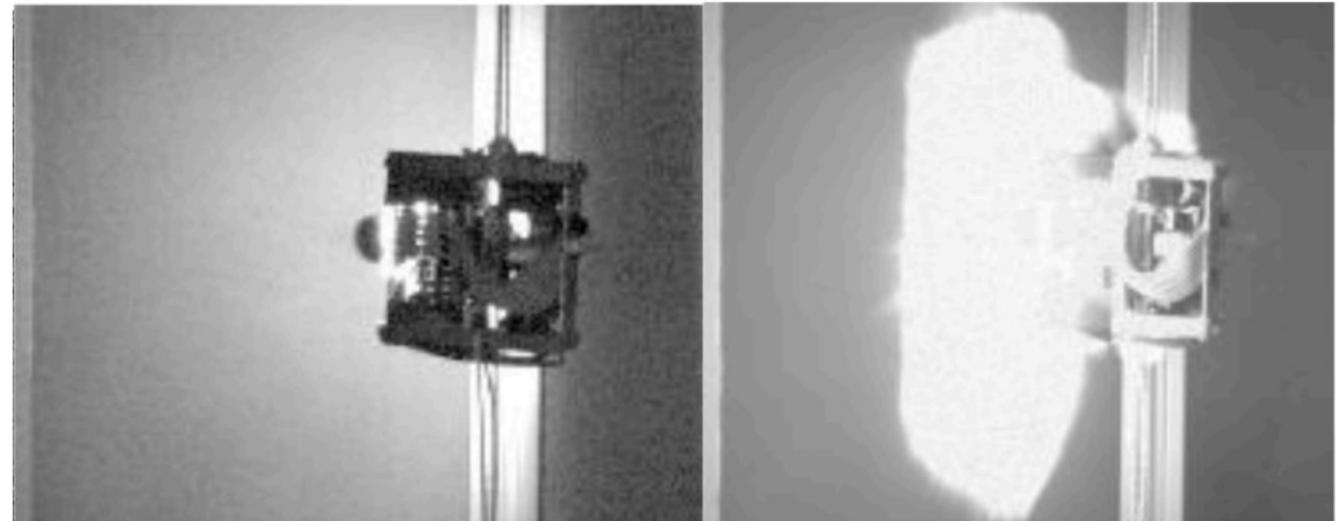

Evolution in All Orbits

Modelling fragmentation events

- Study of fragmentation models
 - Hypervelocity collision testing
 - Materials fragmentation models
 - Simulation
 - Complex structures models
- Study of vulnerability
 - Models depending on precise geometry

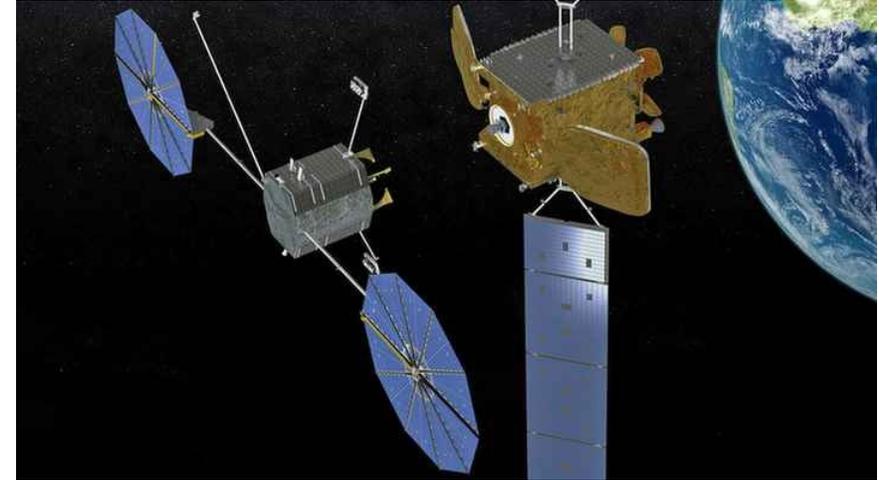

In-orbit capture operations

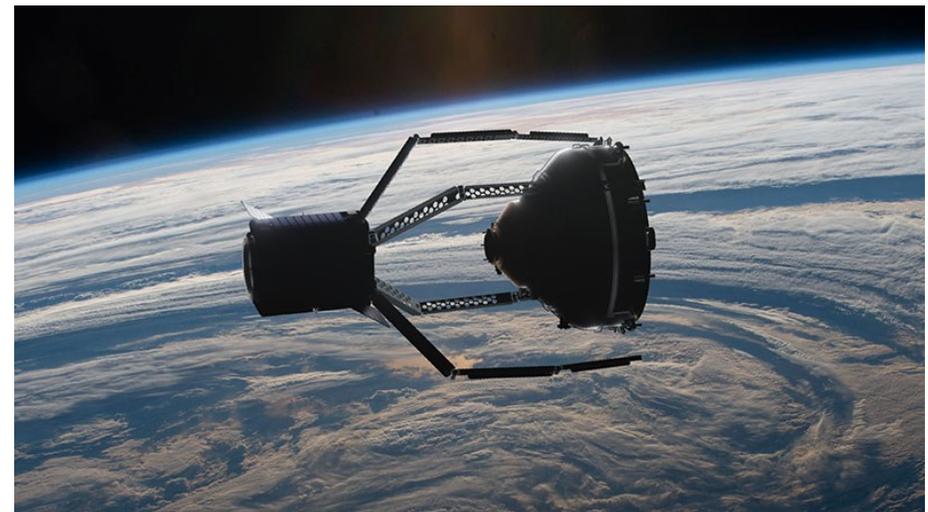

- In orbit servicing (IOS)
 - Orbit maintenance or modification
 - Refuelling
 - Repairing
 - Assembling
- Active Debris Removal (ADR)

MEV-1 & MEV-2 missions (2020 - 2021)

ClearSpace-1 mission (2028)

Doctoral work objectives

Modelling of fragmentation effects

Study of local
fragmentation models

Numerical modelling of
complex structures

Consequences and
vulnerability model

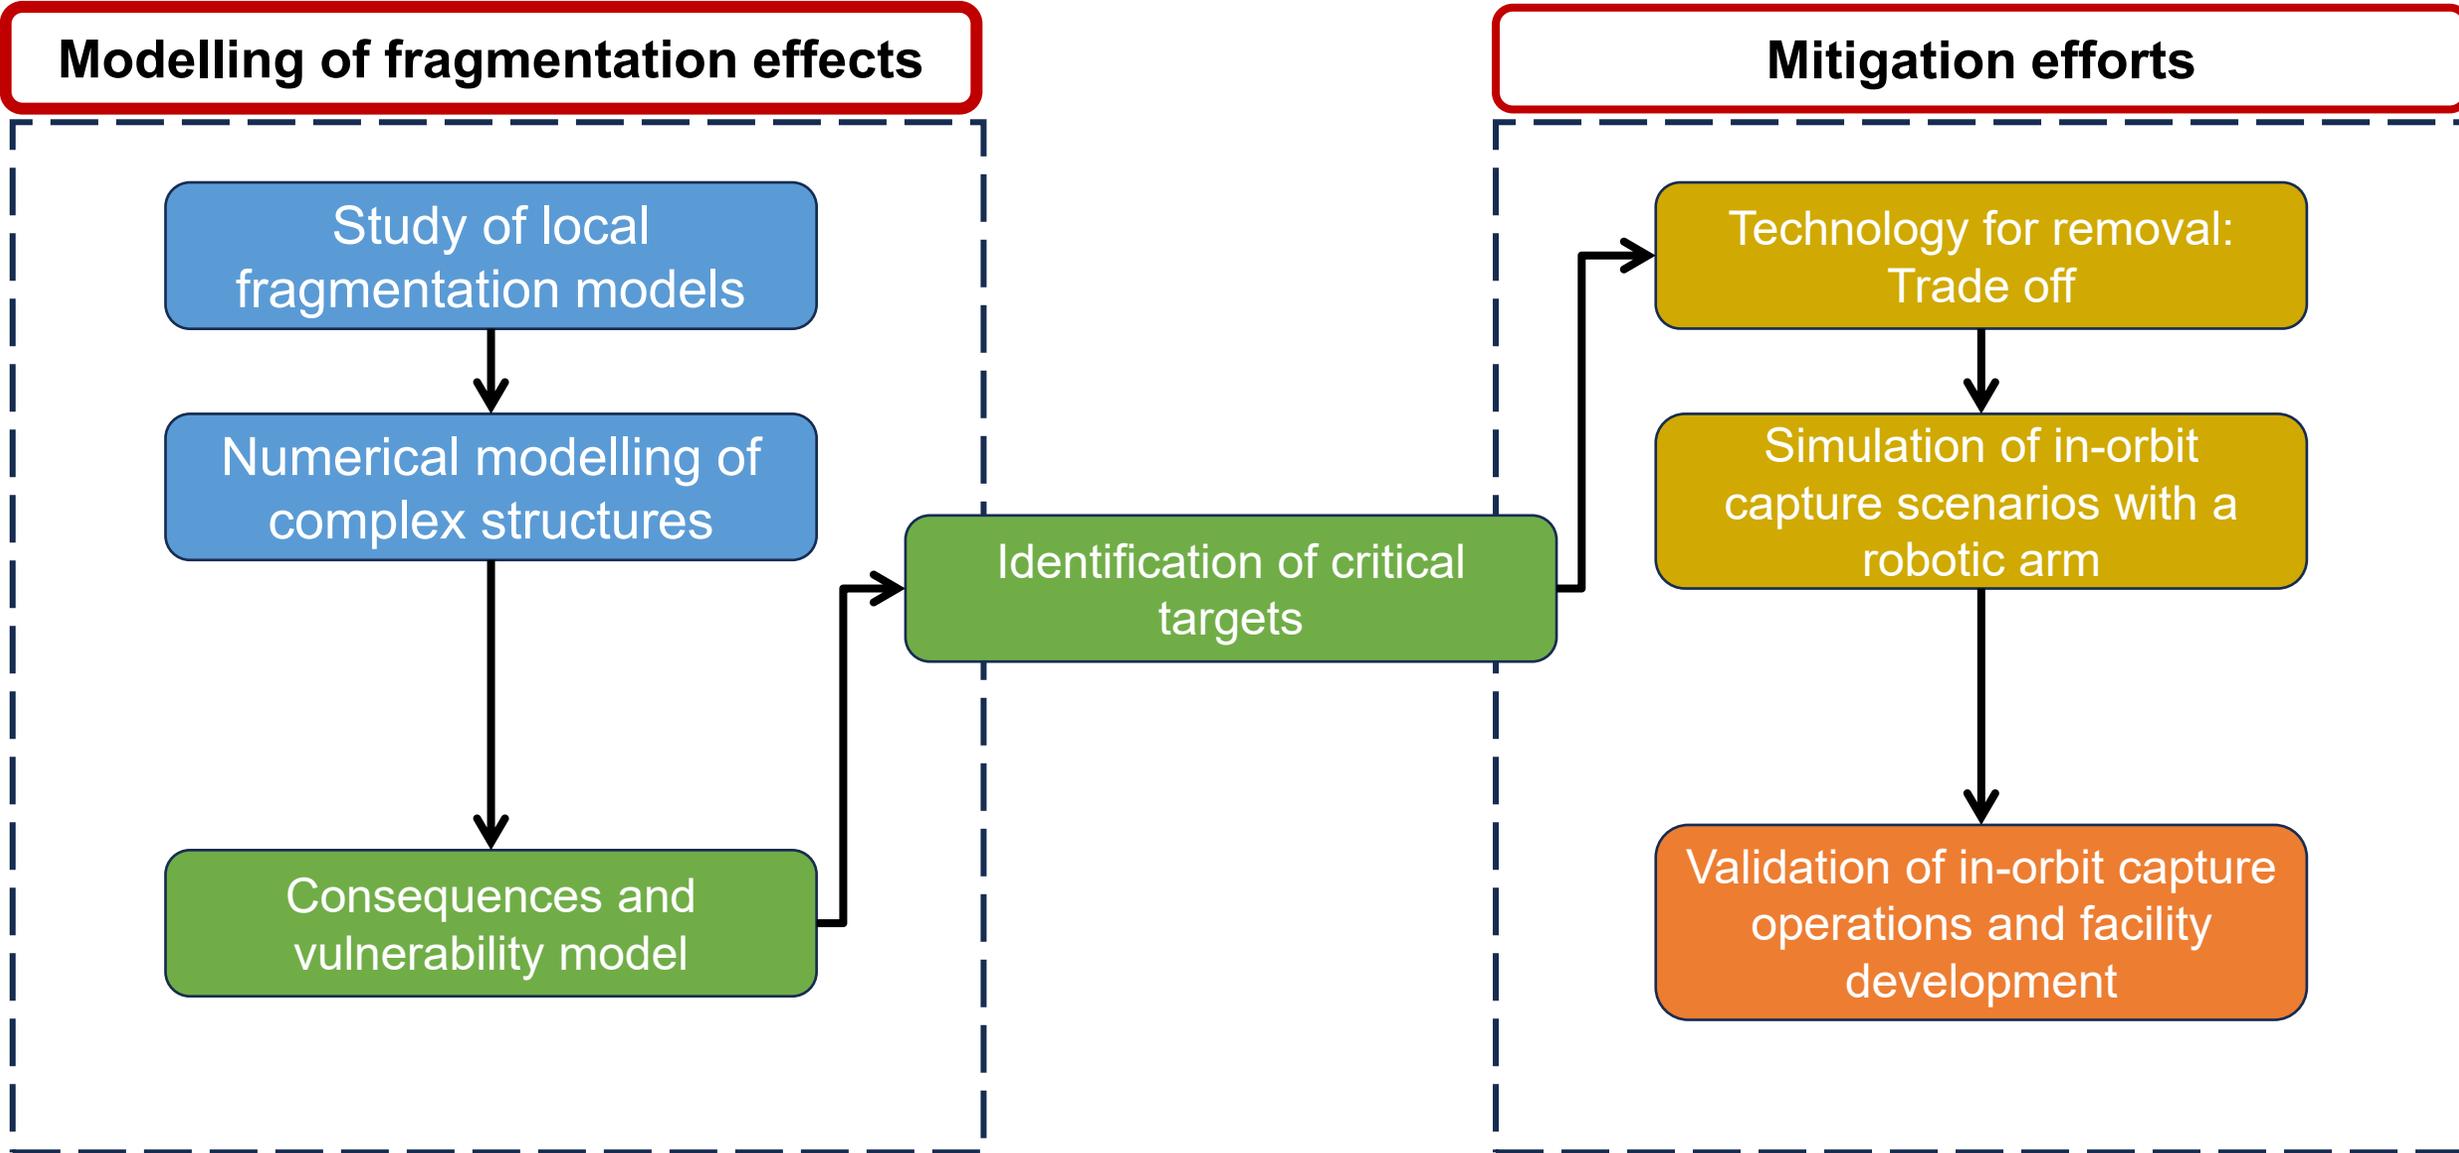

Identification of critical
targets

Mitigation efforts

Technology for removal:
Trade off

Simulation of in-orbit
capture scenarios with a
robotic arm

Validation of in-orbit capture
operations and facility
development

Project description

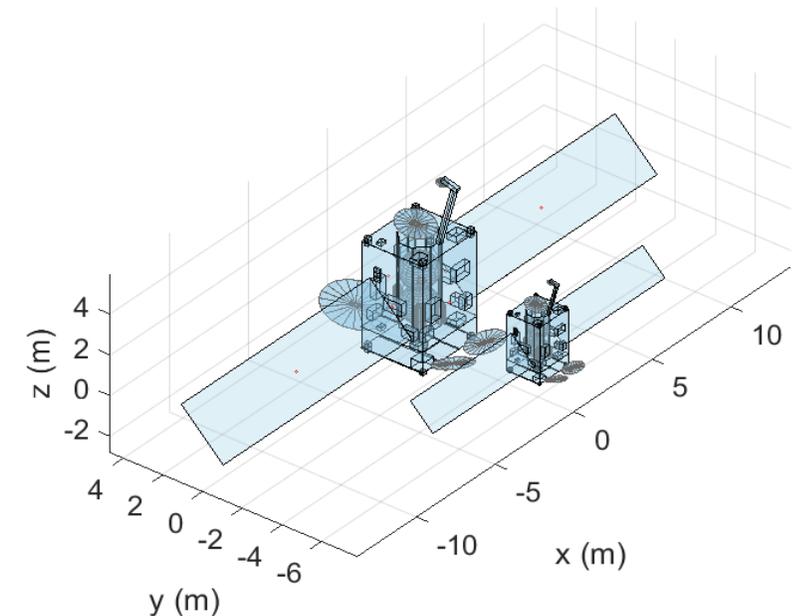

Study of the local and global fragmentation effects

- **Experimental** activities to study HVI fragmentation.
- Study of **local** fragmentation models and integration in **CSTS**.
- Study of **global** fragmentation behaviour of complex structures.

Vulnerability model and candidate spacecraft identification

- **Statistical fragmentation analysis** of a satellite model varying impactor parameters.
- Generalization of the **vulnerability model** to relate vulnerability level to simple-to-obtain parameters.
- Identification of **potential candidates** for ADR and IOS.

Project description

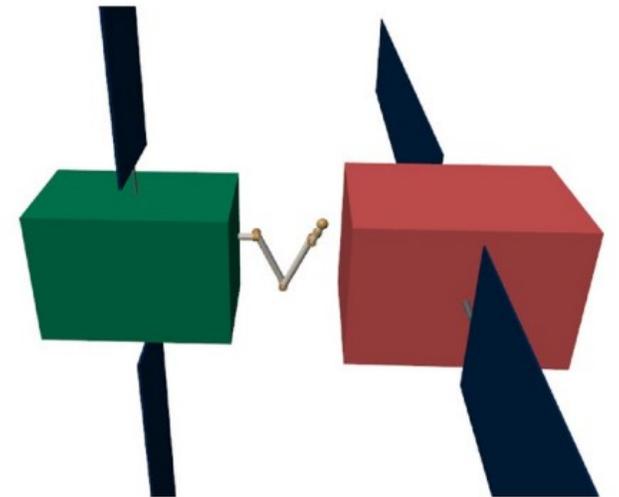

Simulation of capture scenarios

- Study of the **kinematics**, **dynamics** and **control** of the capture operation, considering the influence of disturbances, forces during the contact and the possible deformation of flexible structures.
- **Simulation** of selected **capture scenarios** using a GNC software implementing a combined-control approach.

Experimental validation of capture scenarios

- **Development** and **optimization** of the laboratory **facility** to reproduce close-proximity operations and capture with a robotic arm in a downgraded environment.
- **Experimental validation** of the simulated capture scenarios.

Main expected results

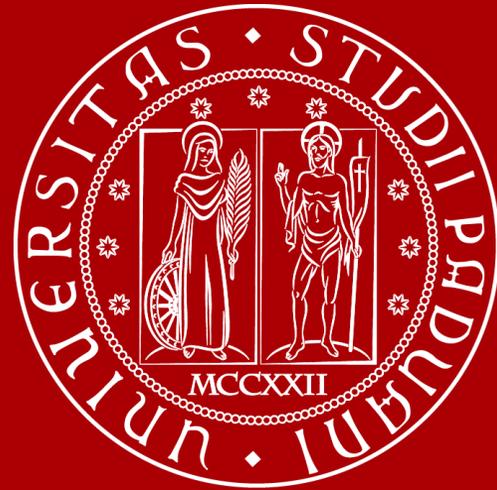

Modelling of fragmentation effects:

- Extend the knowledge about **local** and **global fragmentation** behaviour after a hypervelocity collision.
- Development of a **model** that can relate the **vulnerability** level of a satellite to observable and **simple** to obtain parameters.

In-orbit capture operations:

- Experimental **validation** of an innovative **GNC software** for describing in-orbit capture scenarios with a robotic arm.
- **Development** of the close-proximity operations **facility**.

Thanks for the attention
