Innovative Technologies for Autonomous Navigation and Capture of Uncooperative and Unprepared Satellites

Lorenzo Galante - 41th Cycle

Meeting - 12/11/2025

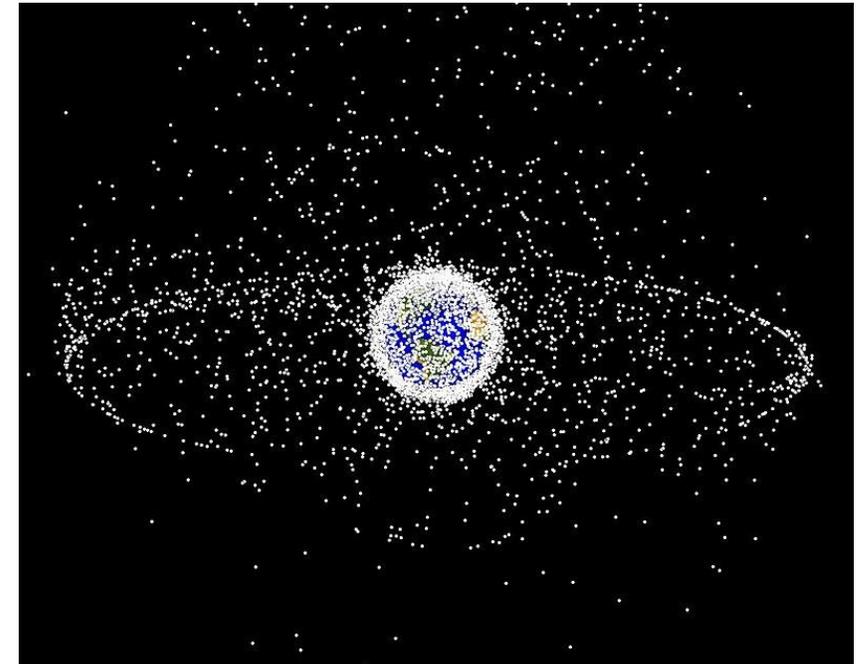

1

Introduction

Increasing congestion of Earth's orbit threatens the sustainability of space activities

An extremely critical aspect is the capture and disposal of non-cooperative targets, especially in tumbling motion

These objects lack transponders, markers, or docking fixtures that could facilitate capture

2

Project description

To address these challenges, the European Commission funded the gEICko (Gecko-inspired Innovative Capture Kit for uncooperative and unprepared orbital assets) project

The aim is to develop a novel capture kit for non-cooperative objects

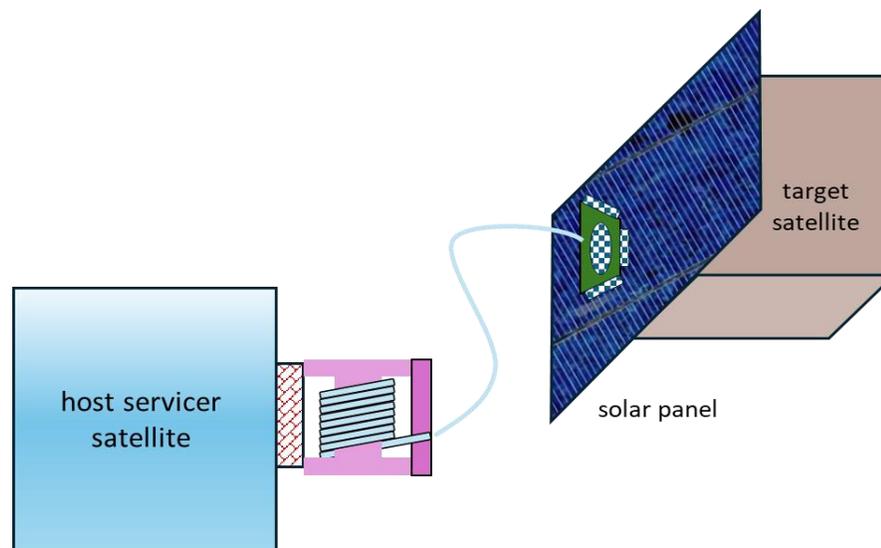

Gecko-inspired micro-patterned dry adhesives (MDAs) to allow secure and reversible attachment to a wide range of surfaces

3

PhD proposed approach

Capture kit: Tip mass equipped with MDAs connected to the chaser spacecraft via a non-conductive tether

Focus on design, simulation, and experimental validation of a prototype capture kit

4

Research goals

Design and implement a modular simulation framework integrating tether dynamics, target models, pose estimation and tracking, and GNC algorithms

Design and prototype a tether deployment mechanism compatible with MDA-based capture

Validate the concept through simulation and experimental testing in relevant environments

5

Methodology (1/2)

State of the art definition

- Active debris removal systems analysis
- Operational context and main challenges identification
- Mission scenarios and ConOps definition

Design phase of the tether deployment mechanism

- Requirements definition
- Mechanism and interfaces design

5

Methodology (2/2)

Simulation framework development phase

- Dynamic model development
- Environmental model implementation
- Validation through benchmark scenarios and performance analysis

Testing phase

- Detailed design
- Prototype manufacturing and assembly
- Experimental campaign

6

Work plan (1/2)

TASK 1: Literature Review and Mission Definition

TASK 2: Computer Vision-Based Target Detection and Approach Guidance

TASK 3: Simulation Environment for Tether-Based Capture Systems

TASK 4: Tether Deployment Mechanism Design

TASK 5: Experimental Test on Prototype

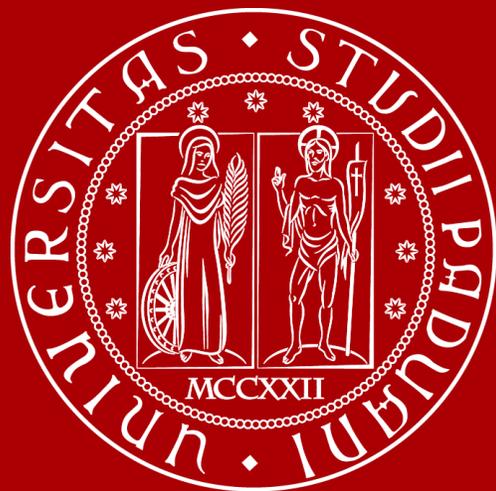

TASK 6: Thesis Writing and Dissemination

6

Work plan: GANTT (2/2)

TASKS		YEAR 1				YEAR 2				YEAR 3			
		Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4
T1	Literature Review and Scenario Analysis	█											
	Mission Scenario Definition and Characterization		█	█									
	Concept of Operations (ConOps) Development		█	█									
T2	Pose Estimation and Tracking Algorithms				█	█							
	Integration within GNC simulation framework						█	█					
	Experimental Validation								█	█	█		
T3	Tether Dynamics Characterization and Control Design				█	█							
	GNC for Capture of Non-Cooperative Targets with Tethered Systems					█	█	█					
	System Validation with Known Scenarios						█	█					
	Vision-Based Module Integration							█					
	Simulation of Specific Mission Scenarios							█	█				
T4	Conceptual Design Study						█						
	Mechanical and Functional Design							█					
	Prototype Testing and Validation									█	█	█	
T5	Prototype Realization and Test Preparation								█				
	Experimental Campaign									█	█	█	
	Dataset Acquisition and Preparation											█	█
T6	Data Analysis and Model Refinement											█	█
	Thesis Writing and Dissemination											█	█

Thank you for your attention!
