# Study and Development of a H<sub>2</sub>O<sub>2</sub> based Liquid Rocket Engine

# LRE-Liquid Rocket Engine

## Advantages

- High specific impulse
- Two controllable feeding lines
- Operation flexibility
  - Multiple shut down & re-ignition
  - Mass flow throttling
  - Mixture ratio control
- Long burning times

## Disadvantages

- High manufacturing costs
- Technological complexity

## In Space Propellant:

High combustion temperature

Different cooling system solutions

## Passive methods

- Small scale thruster
- Very expensive materials

## Active methods

- Large scale engine
- Regenerative cycle
- Technological complexity

---

# New Space Economy

- Low cost →
  - Performance →
  - Environmental friendliness →
  - Controllability
  - Customization capability
- Manufacturing
  - Propellant
- 

## Versatility

- Monopropellant
- Bipropellant

- Not toxic for humans
- Environmental friendly
- High volumetric specific impulse
- Easy storable at room temperature

# Hydrogen Peroxide

High Test Peroxide (HTP)  
Mass Concentration > 80%

## Performance

- Bipropellant

$$ISP_{MMH/N_2O_4} \cong ISP_{HTP/RP1}$$

LRE

Combustion Chamber

- Fuel injector
- Cooling system

Nozzle

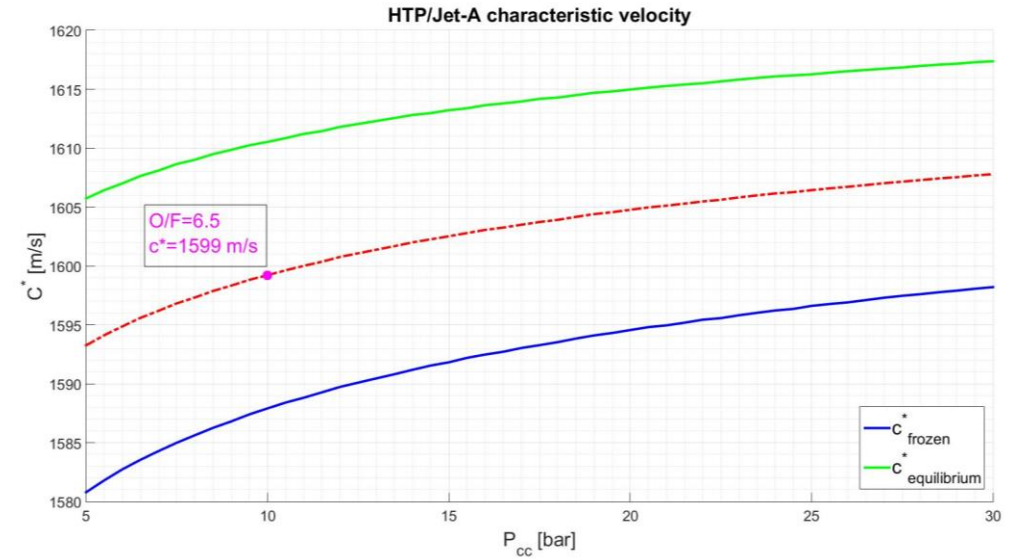

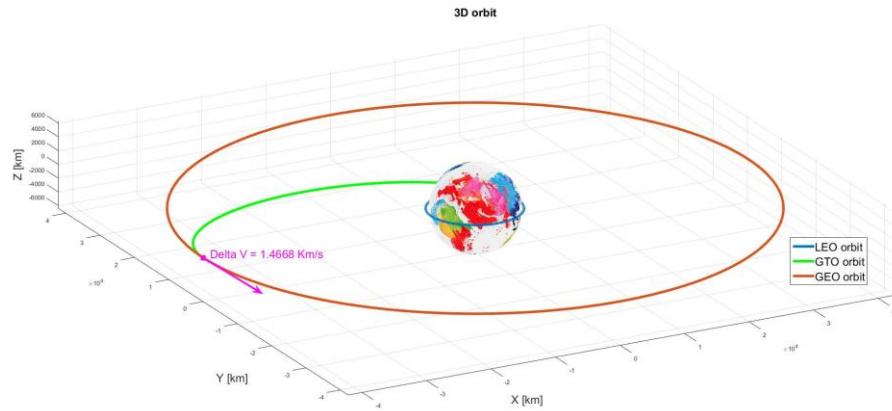

- Cooling system

Catalytic Bed

- Volume

Additive Manufacturing?

# Preliminary design

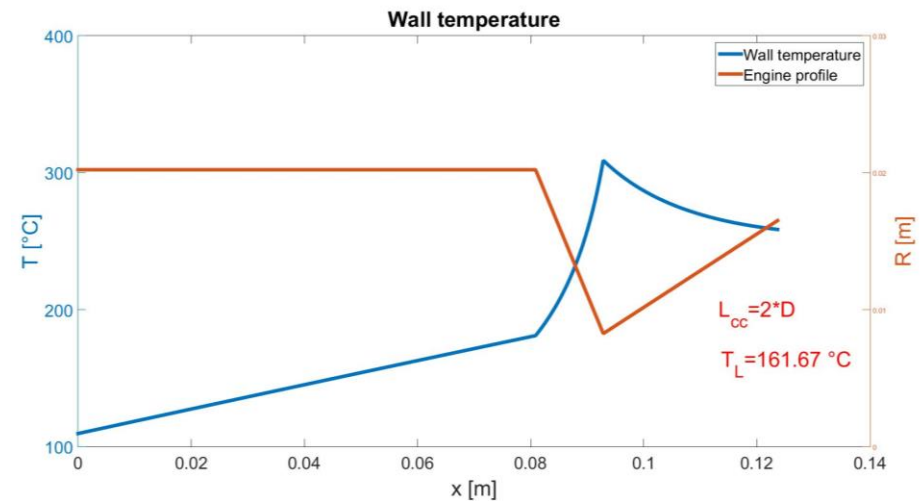

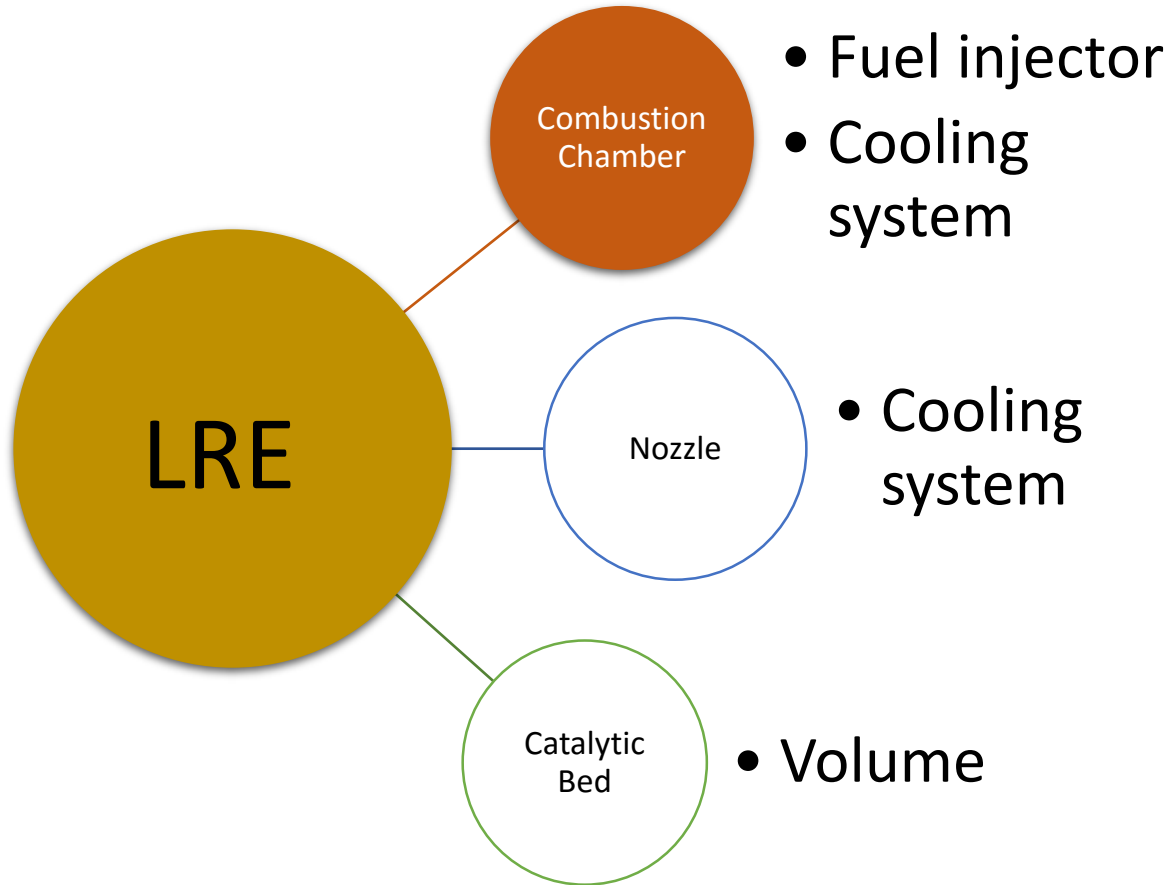

## Kick Apogee Motor

$\dot{m}$	120 [g/s]
OF	6.5
Oxidizer	HTP 91.5%
Fuel	Kerosene
MEOP	10 [bar]
$\epsilon$	220 – 330
T	420 – 440 [N]
Isp	310 – 330 [s]
$\Delta V$	1.4888 [km/s]
tb	1.456 [hours]

$$\dot{m}_{cool} = \dot{m}_{OX}$$

$$T_{Lmax} = 120^\circ\text{C}$$

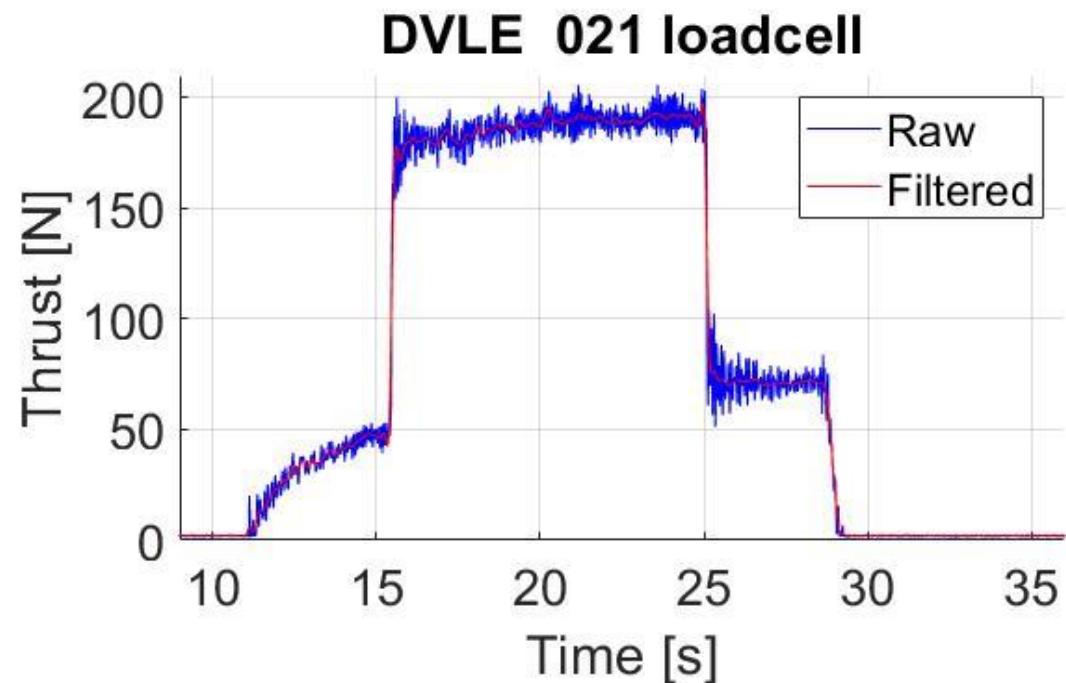

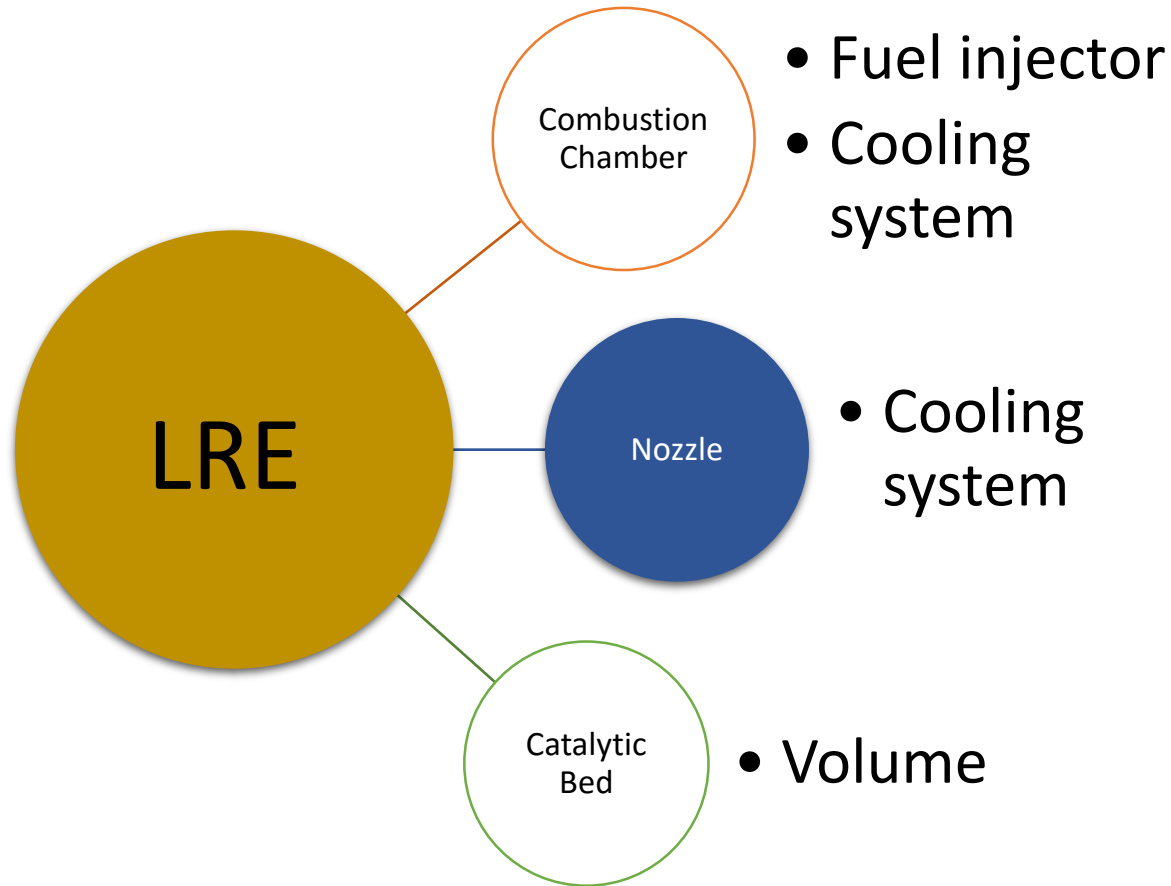

# Experimental activity

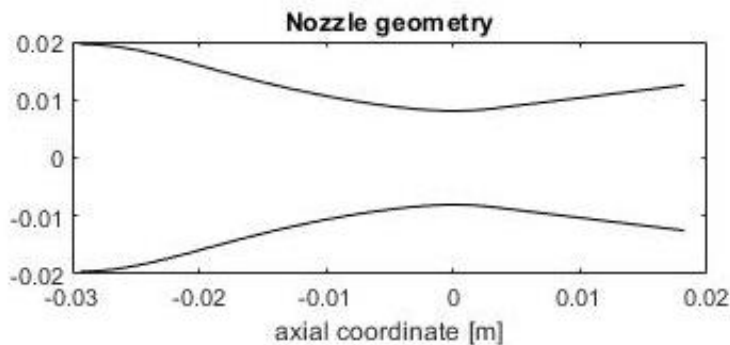

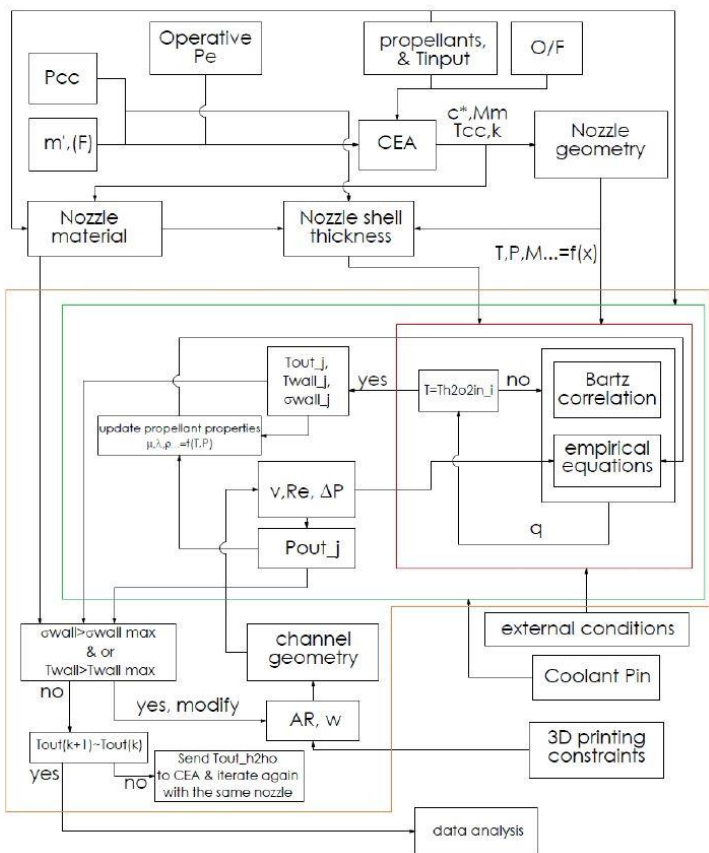

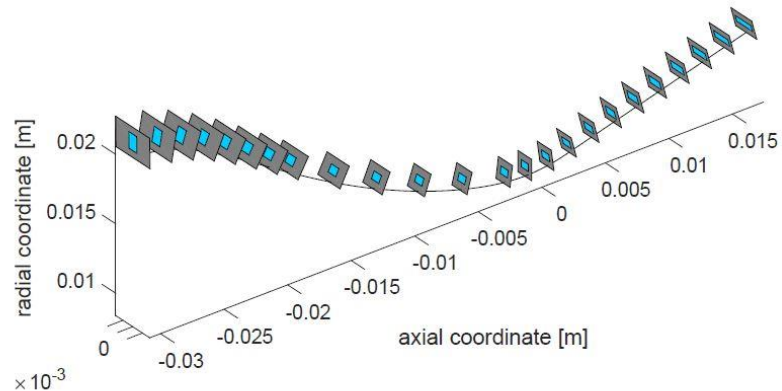

N°test	ISP eff	Tmax wall
21	0,85	630 °C

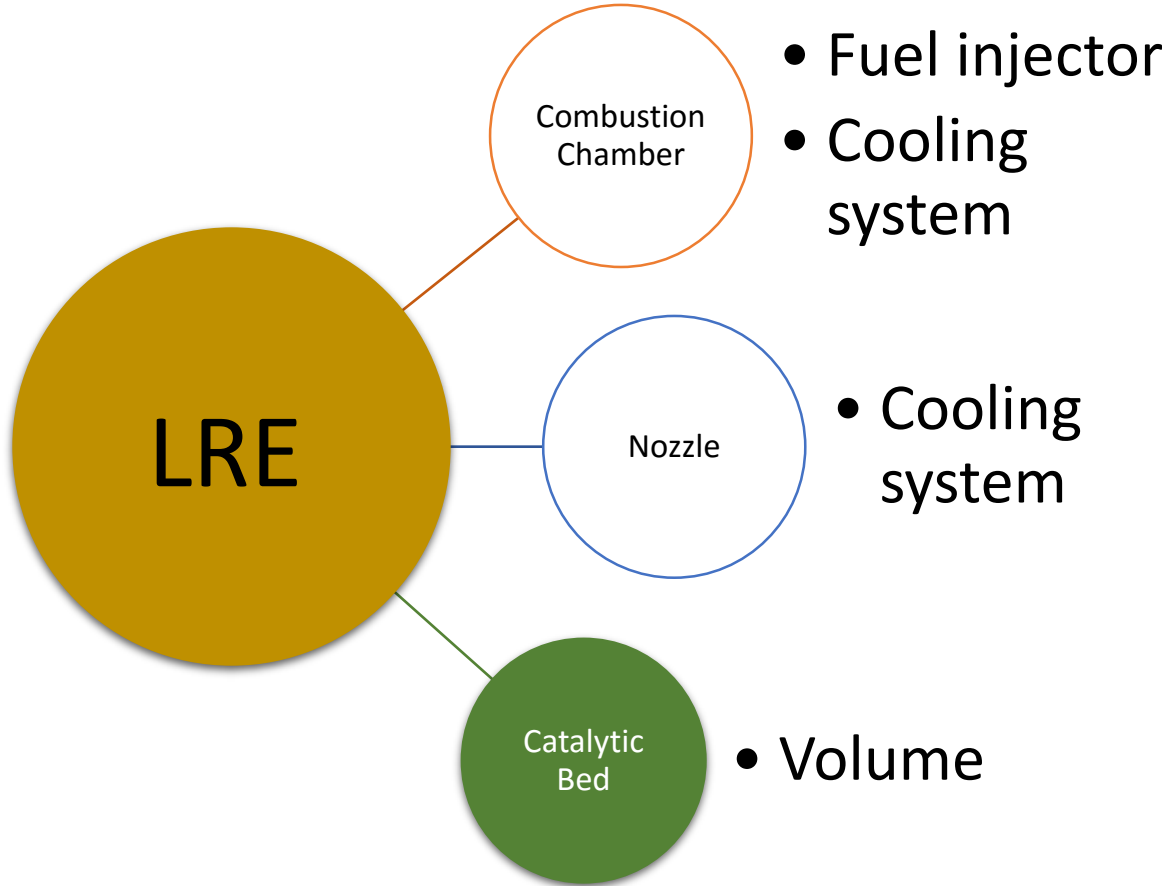

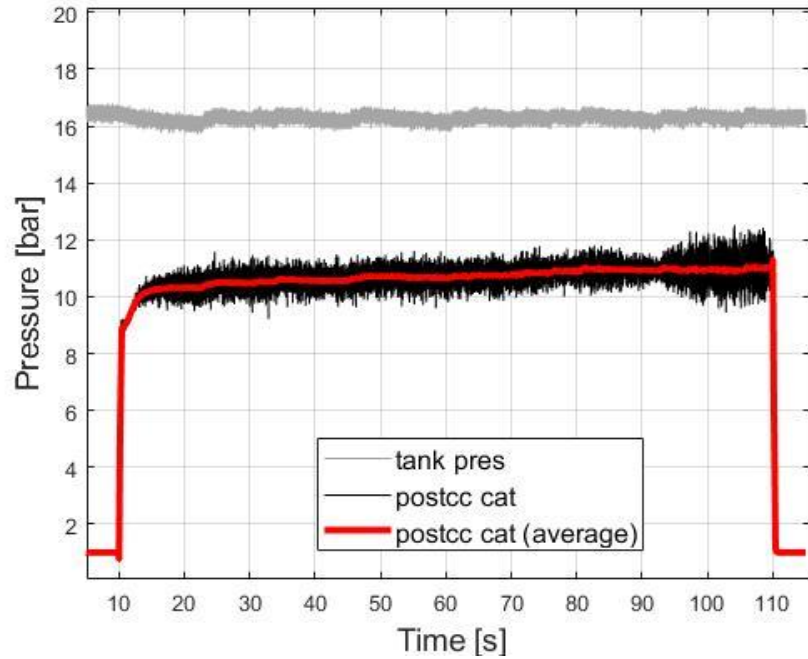

# Nozzle

# 10N Monopropellant

tb [s]	c* eff	Twall_max [°C]
100	0,93	680

Outcome

1. 3D printing Knowledge
2. Material capabilities
3. Catalytic Saturation Volume
